nano:ztag

mir:ror

nabaztag:tag

nano:ztag

ztamp:s

nano:ztag

Small. Cute. Still smart.

Three times smaller than Nabaztag, their elder, Nano:ztags are just as adorable. In this first "Native" collection, they have bred into **10 luscious colours** that only chance will select for you. **Collect them all, exchange them with your friends**, create your own combinations by mixing the colours of their removable ears.

Although Good Looks are great, Intelligence is even better – so these micro-Rabbits contain a **programmable RFID Ztamp**. You can program them through the Violet.net website and, when you show them to a [Mir:ror](#) or [Nabaztag:tag](#), they will launch the content and applications you have assigned. Picture the scene: your Kiwi-coloured Nano:ztag launches your favourite iTunes playlist when you place it on your [Mir:ror](#); give a Nano:ztag to your loved one, and each time that he or she shows it to his or her [Mir:ror](#) or [Nabaztag:tag](#), he or she will hear your declarations of love; launch text-to-speech playback of any RSS feed on your favourite websites simply by flashing your blue-eared orange Nano:ztag in front of your [Nabaztag:tag](#). And these are just a very few examples of the thousands of uses that users can make up as they go.

Your Nano:ztags carry all your services with them, like a pocket-size Nabaztag. Program them and show them to any [Mir:ror](#) or [Nabaztag:tag](#) you meet, and they'll launch your content or services* for you.

You will find a random-coloured Nano:ztag included in the [new Nabaztag:tag packs](#) and two random-coloured Nano:ztags in the [Mir:ror packs](#).
